

# MOSIP Inji Local Full Stack Setup Guide

## Verified Mimoto Backend

Started Spring Boot app, verified port 8099, found context path /v1/mimoto, opened Swagger and API docs, tested issuers/verifiers endpoints.

## Identified Dependencies

Mimoto requires Mock Issuer, Credential Offer, OpenID4VP, VC Renderer and optionally eSignet/WebSub.

## Mock Services Found

credential-offer-service, mock-issuer-service, openid4vp-service, inji-vc-renderer-mock-service.

## Mock Issuer Fix

Generated server.key and server.cert using OpenSSL because cert files were missing. Service then started on HTTPS port 4000.

## Credential Offer Service

npm install, then node index.js. Running on localhost:3000.

## VC Renderer

npm install, then npm run mock-renderer. Running on localhost:3008.

## OpenID4VP Fix

Changed app.js port from 3000 to 3001 due to port conflict. Updated frontend constant accordingly.

## Issuer Verification

Verified /.well-known/openid-credential-issuer endpoint returned issuer metadata.

## Frontend Discovery

Located frontend at D:\MOSIP\inji-web\inji-web and confirmed package.json and node\_modules exist.

## Startup Order

1) Mimoto 8099 2) Mock Issuer 4000 3) Credential Offer 3000 4) OpenID4VP 3001 5) VC Renderer 3008 6) Inji Web Frontend.
